Lib 2024-Internet Applications

Innovation Report

Throughout the semester of Internet applications class, I learned about HTML, CSS, JS, and Github. I learned how to create my first page from HTML, and I also learned how to make my HTML page design with CSS and javascript. Learning this was my first time doing web development and learning how to code my webpage. I learned that HTML, CSS, and Javascript are the backbone of web development, although there are tools like adobe that can help build your webpage. These are essential skills that need basic knowledge in order to make your webpage from scratch and to understand coding.

I believe learning about these technologies is essential for innovation in Library and Information Services because library and information services are becoming more of a technology-driven profession. Especially in academic libraries where librarians are helping students, researchers, and professors with questions that may require information on technology and web development. I think even in public libraries, it is essential for librarians to know how to use and understand HTML, CSS, and Javascript because these three are essential when it comes to beginning web development. I think if some of the staff understands how to use those types of computer software, it can increase their client experience on those wanting to learn about HTML, CSS, and Javascript.

I also think the websites and information given in class are also important because many people, including myself, can find learning about web development confusing and can take time to learn. It is essential to have the right and accurate information from websites. I think it is important for librarians and information services to have the knowledge on which websites and sources are accurate and can help their clients with answers they may need for web development. This is also a valuable knowledge to have because finding the right and useful answers that can help their clients is an essential duty for librarians.
